Threat Analysis with Uptycs

Release Notes

Version	Date	Notes
1.0.0	03/2024	Initial Release

Overview

Responds to threats everywhere across the cloud, endpoints, containers, and K8s systems

It is a robust extension that seamlessly integrates with the Uptycs platform to retrieve real-time alerts data and analyze potential security threats.

This integration empowers security teams to proactively monitor, analyze, and respond to security incidents within their organization's IT infrastructure, ensuring timely detection and mitigation of threats.

Key Features

- Retrieve Uptycs data into the IBM QRADAR SOAR
- Threat Analysis on Uptycs Data (both alerts and detections)
- Automating the threat analysis process with uptycs alerts and detections

Requirements

This app supports the IBM Security QRadar SOAR Platform and the IBM Security QRadar SOAR for IBM Cloud Pak for Security.

SOAR platform

The SOAR platform supports two app deployment mechanisms, App Host and integration server.

If deploying to a SOAR platform with an App Host, the requirements are:

- SOAR platform **>= 50.0.9097**.
- The app is in a container-based format (available from the AppExchange as a **zip** file).

If deploying to a SOAR platform with an integration server, the requirements are:

SOAR platform **>= 50.0.9097**.

The app is in the older integration format (available from the AppExchange as a **zip** file which contains a **tar.gz** file).

Integration server is running **resilient-circuits>=51.0.1.0.0**.

If using an API key account, make sure the account provides the following minimum permissions:

Name	Permissions
Org Data	Read
Function	Read

The following SOAR platform guides provide additional information:

- *App Host Deployment Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings.
- *Integration Server Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings.
- *System Administrator Guide*: provides the procedure to install, configure and deploy apps.

The above guides are available on the IBM Documentation website at ibm.biz/soar-docs. On this web page, select your SOAR platform version. On the follow-on page, you can find the *Edge Gateway Deployment Guide*, *App Host Deployment Guide*, or *Integration Server Guide* by expanding **Apps** in the Table of Contents pane. The System Administrator Guide is available by expanding **System Administrator**.

Cloud Pak for Security

If you are deploying to IBM Cloud Pak for Security, the requirements are:

- IBM Cloud Pak for Security >= 1.10.15.
- Cloud Pak is configured with an Edge Gateway.
- The app is in a container-based format (available from the AppExchange as a [zip](#) file).

The following Cloud Pak guides provide additional information:

- *App Host Deployment Guide*: provides installation, configuration, and troubleshooting information, including proxy server settings. From the Table of Contents, select Case Management and Orchestration & Automation > **Orchestration and Automation Apps**.
- *System Administrator Guide*: provides information to install, configure, and deploy apps. From the IBM Cloud Pak for Security IBM Documentation table of contents, select Case Management and Orchestration & Automation > **System administrator**.

These guides are available on the IBM Documentation website at ibm.biz/cp4s-docs. From this web page, select your IBM Cloud Pak for Security version. From the version-specific IBM Documentation page, select Case Management and Orchestration & Automation.

Proxy Server

The app **does not** support a proxy server.

Python Environment

Python 3.11 or later versions are supported. Additional package dependencies may exist for each of these packages:

- resilient-circuits>=51.0.1.0.0
- requests>=2.31.0

Installation

Install

- To install or uninstall an App or Integration on the *SOAR platform*, see the documentation at ibm.biz/soar-docs.
- To install or uninstall an App on *IBM Cloud Pak for Security*, see the documentation at ibm.biz/cp4s-docs and follow the instructions above to navigate to Orchestration and Automation.

App Configuration

The following table provides the settings you need to configure the app. These settings are made in the app.config file. See the documentation discussed in the Requirements section for the procedure.

Config	Required	Example	Description
uptycs_api_key	Yes	<key_value_of_uptycs_api_keys>	key value of Uptycs API keys
uptycs_api_secret	Yes	<secret_value_of_uptycs_api_keys>	secret value of Uptycs API Keys
uptycs_customer_id	Yes	<uptycs_customer_id>	Your Uptycs Customer ID
uptycs_domain	Yes	<domain_name_of_uptycs_stack>	Domain of your Uptycs Stack
uptycs_domain_suffix	Yes	<domain_suffix_of_uptycs_stack>	Domain Suffix of your Uptycs Stack

Output definition ⓘ

Define Output

Description

output contains the response data in json format

Error types :-

REQUIRED_FIELD : Missing required field

INTERNAL_ERROR : Error processing request due to error on server side...

Show more

Output JSON example

```
{
  "id": "41d22ce6-1a54-4bb8-9ffb-0aa519658084",
  "customerId": "11111111-1111-1111-1111-111111111111",
  "seedId": "BAD_DOMAIN_ANONYMIZER",
  "name": "Bad domain - Anonymizer",
  "description": "Check if the domain is known threat",
  "code": "BAD_DOMAIN_ANONYMIZER",
}
```

Show more

► Inputs:

Name	Type	Required	Example	Tooltip
uptycs_api_endpoint	text	Yes	-	API Endpoint to be called
uptycs_api_method	text	Yes	-	Request method for an API
uptycs_api_payload	text	Yes	-	Payload for the API call.

► Outputs:

NOTE: This example might be in JSON format, but **results** is a Python Dictionary on the SOAR platform.

```
results = {
  "items": [
    {
      "alertConfig": {},
      "alertNotifyCount": null,
      "alertNotifyInterval": null,
      "alertRuleExceptions": [],
      "alertRuleQueries": [],
      "alertTags": [
        "ANONYMIZER",
        "DOMAIN",
        "THREAT-INTEL",
        "UPTYCS"
      ],
      "code": "BAD_DOMAIN_ANONYMIZER",
      "createdAt": "2023-05-15T20:53:06.519Z",

    }
  ],
  "limit": 1,
  "links": [
    {
      "href": "/api/customers/11111111-1111-1111-1111-111111111111/alertRules",

```

```

        "rel": "self"
    },
    {
        "href": "/api/customers/11111111-1111-1111-1111-111111111111",
        "rel": "parent"
    },
    {
        "href": "/public/api/customers/11111111-1111-1111-1111-111111111111/alertRules?
limit=1\u0026offset=1",
        "rel": "next",
        "title": "Next page"
    }
],
"offset": 0
}

```

► Example Function Input Script:

```

import json

# unique id of the detection
detectionID = incident.properties.uptycs_detection_id

# API endpoint
endpoint = f"/detections/{detectionID}"

inputs.uptycs_api_method = 'GET'
inputs.uptycs_api_endpoint = endpoint
inputs.uptycs_api_payload = json.dumps({})

```

► Example Function Post Process Script:

```

"""
Set Detection data to playbook property named "json_data" to get the corresponding Rich Text HTML Code
"""

jsonData = {
    "heading": "Uptycs Detection Data",
    "content": playbook.functions.results.detectiondata.content
}

playbook.addProperty('json_data', jsonData)

```

Script - JSON TO HTML (RICH TEXT)

Converts provided JSON Data to Rich Text and adds it as a note to the corresponding Incident

Object: incident

► Script Text:

```

"""
Set the Json Data that you would like to convert to rich text in a playbook property called "json_data"

```

```
using playbook.addProperty('json_data', JSON_DATA)
```

JSON_DATA should have two keys, heading and content.

```
ex: JSON_DATA = {
    "heading" : "Uptycs Alert Data",
    "content" : {},    =====> json object
}
```

It converts the provided json to rich text and adds that as a note to the corresponding incident.

Go to Notes Tab to observe the corresponding Rich Text View of the JSON DATA.

```
"""
```

```
""" Don't Modify below lines of code """
```

```
def json_to_rich_text(data, initial_padding, padding=10):
```

```
    html = ""

    if isinstance(data, dict):
        for key, value in data.items():
            if isinstance(value, dict):
                html += "<strong style='padding-left:{0}px; color: #3366cc;'>{1}</strong><br><strong style='padding-left:{0}px; color: #1adf17;'>{2}</strong><br>".format(
                    initial_padding, key, json_to_rich_text(value, initial_padding + padding, padding)
                )
            elif isinstance(value, list):
                if len(value) == 0:
